

WordPress Security & Performance Report

Prepared By : Muhammad Hasnain Munir

Current Status

A malware infection was detected on the website due to the use of pirated/cracked plugins. The malware was redirecting traffic and creating security risks.

The website was cleaned successfully 2 days ago, and all infected files and malicious code were removed.

Performance Issues

Currently, website performance is below expectations. Some speed and stability issues are caused by outdated and cracked plugins.

Recommended Plugins

To improve security, performance, and SEO, it is strongly recommended to purchase and use the original licensed versions of:

Elementor Pro

- Professional website builder
- Easy content and design management

WP Rocket

- Speed optimization
- Better SEO performance
- Faster page loading

Imagify

- Image optimization
- Improved website speed

Conclusion

The malware has been removed, and the website is now secure. However, replacing cracked plugins with original licensed versions is necessary to prevent future infections and improve overall website performance.
